

# EU project LSFM4LIFE. A new video to raise awareness about type 1 diabetes (T1D)

*Promising new angle on curing type 1 diabetes*

The LSFM4LIFE project continues on with the **devoted work on finding a long-term solution to cure type 1 diabetes**. A sustainable and effective cure for the disease is a very important unmet need that the research performed by the LSFM4LIFE project aims to find a solution for.

On January 30th, LSFM4LIFE launched a video to raise awareness about T1D and communicate on the ambitious objectives of the project. The video is available on YouTube via the account of Sparks & Co, the project's partner responsible for communication and dissemination.

This communication materials are part of a wider awareness-raising process around this project and it is suitable for all audiences.

Diabetes is a common chronic disease that affects more than 415 million people throughout the world. Around 10 percent of those people, suffer from type 1 diabetes, an emerging epidemic worldwide which incidence is increasing at a pace of 3 to 4 percent every year, especially among children.

**The LSFM4LIFE project is a promising step towards the end of type 1 diabetes.**

This research project, involves 8 partner teams from 6 different European countries. These partners are dedicated to develop tools and technologies for a cell-based therapy. By achieving its goal, the LSFM4LIFE project will enable human pancreatic organoids (hPOs) transplantation that will relieve T1D patients from monitoring and injecting insulin.
